

A Growing Presence on the River: Autonomous Boats

Michael Valentino Ochoa (LAST REVISION: 3/2/20)

I. MOTIVATION

Global sea level rise will be one of the greatest challenges facing our society this century, and understanding how this phenomenon will reverberate onto riverway communities will require a regular presence. We believe our autonomous boat can be that regular riverway presence.

In this paper we present the hull design, sensor kit and technology stack for an autonomous boat. The boat uses a high definition camera and sensors to generate a detailed portrait of the river to intelligently control its steering dynamics.

The two major contributions of this paper are designing suitable control laws for the boat's steering dynamics (steering angle, throttle/brake), on which collective algorithms for lane keeping, obstacle detection, active cruise control and localizing its center of buoyancy can be assessed. The second contribution is a customer facing business plan that blends old

world traditions (Venetian water taxis) and the modern culture that characterizes Chicago (hospitality, delivery systems and autonomous transportation services).

This paper is structured as follows:

Section II presents the hull design and sensor kit. Section III draws out the technology stack for the Riverway Awareness and and Warning System (RAWS). Section IV thru X describe RAWS in greater detail. Field testing and results are unpacked in Section XI and Section XII gives way to the discussion. To conclude Section XIII presents the customer facing business plan.

II. HULL DESIGN & SENSOR KIT

It's an age old question, should you transport more cargo/people on a slow boat, or less cargo/people on a faster boat. We believe less is best.

A Growing Presence on the River: Autonomous Boats

Michael Valentino Ochoa (LAST REVISION: 3/2/20)

To establish the hull's design we use simulation software to guide the design of a low drag hull. To construct the hull (approximately 1:8) we laser cut marine grade plywood and couple it with 3D printed components. Next, within a leak proof housing we add a mini computer, micro controller, wifi adapter and GPS beacon. The boat's components are then married together with zip ties and epoxy thickened with wheat flour. Finally solar panels and thrusters are added to bring our proof of concept to life.

With the hull and body established we add our sensor kit consisting of: (1) high definition color camera, (2) 2D LiDAR sensors, (2) thermal radars, (1) sonar sensor and (1) Inertial Movement Unit sensor (IMU) which help the boat localize "Where am I? Where is everyone else?" to centimeter level precision.

Michael Valentino Ochoa (LAST REVISION: 3/2/20)

III. RIVERWAY AWARENESS AND WARNING SYSTEM (RAWS)

Our technology stack, which goes by the name of RAWS generates a detailed image of the riverway with auditory and visual warning. The technology stack stretches across seven interconnected layers detailed in secants IV thru X.

Technology Stack

Sensors A

High Definition Color Camera,
Thermal Radar, 2D-LIDAR, Sonar

Sensors B

GPS Beacon, IMU Sensor

Perception A

River "Lane" Finder, Vision Mapper
Laser Mapper, Radar Mapper

Perception B

Wave Ruggedness Index
Pose Estimation

Planning & Control

Path Planner, Steering Dynamics
(Steering Angle, Throttle/Brake)

Boat and User Interface

Touch Screen UI, Boat Interface
Power Server Interface,
Emergency Brake

Global Services

"Heartbeats", Data Logger, Inter-
Process Communication Server, File
System

IV. LOCALIZATION (USING HISTOGRAM FILTERS)

+ Where am I?

Construct a histogram filter and blend it with a real map to localize the boat's position, orientation and velocity using the GPS beacon. The histogram filters reflect the boat's understanding of its current location as a probability distribution. Measurement updates (i.e. sensing) use the Bayes Rule and

A Growing Presence on the River: Autonomous Boats

Michael Valentino Ochoa (LAST REVISION: 3/2/20)

motion updates (i.e. movement) use the Theorem of Probability.

V. RIVERWAY PERCEPTION

+ Where is everyone else?

Identify “lanes” and classify obstacles using the boat’s front facing camera

— Tensorflow + CNN

VI. DEEPER RIVERWAY PERCEPTION

+ Where is everyone else?

Determine with certainty the location of others, especially moving obstacles using thermal radar, 2-D LIDAR, sonar. We represent the current state (e.g. position, orientation and velocity) as a vector and uncertainty as a covariance matrix.

— Kalman Filters

VII. BOAT DYNAMICS & WATER PROPERTY ESTIMATION

+ Where is everyone else?

Set maximum speed based on the shock imparted using IMU sensor

— Wave Ruggedness Index

VIII. BEHAVIORAL CLONING

Train a neural net to drive our autonomous boat like a human

— Keras + Transfer Learning

IX. PATH PLANNER

Guide the boat along a pre-planned route by minimizing cost functions for action and terrain. We model the route as a connected graph with costs for traveling between nodes.

X. STEERING DYNAMICS

+ How do I get from A to B?

Send steering, throttle and brake commands to thrusters

— Proportional-Integral-Derivative (PID)

— Model Predictive Controller

XI. FIELD TESTS & RESULTS

A. FIELD TESTING SETUP

Establishing repeatable environments for testing is paramount. Our testing ground stretches between the Goose Island Overlook (1100N) and Park No. 571 (200N) along the North Branch of the Chicago River.

B. RESULTS

XII. DISCUSSION & FUTURE RESEARCH

In the paper we extend the capacity of an autonomous robotic boat to understand:

— Where am I?

— Where is everyone else?

— How do I get from A to B?

We run open water field tests in fog, rain, smoke and dynamic lighting to validate the efficiency and accuracy of the boat's collective algorithms.

Fig. 2. Force Vectors on Boat

A Growing Presence on the River: Autonomous Boats

Michael Valentino Ochoa (LAST REVISION: 3/2/20)

Data from the field tests also helps the boat proactively improve its autonomous practices for lane keeping, obstacle avoidance, active cruise control and localizing its center of buoyancy. The goal is to create an experience that could impress both a safety and sustainability commissioner.

Future research will explore some of the more challenging problems in autonomous transportation — mapping real physical rivers, as they're something that change fast and are very big. Our research extends Professor Geoffrey Hinton et al.'s research to conceptualize a prefrontal cortex, whose dopamine based architecture stamps in associations between pixel-level sensor data flows. We believe this approach helps the boat better establish its own "rules of thumb" about how to safely navigate its preplanned routes.

XIII. CUSTOMER FACING BUSINESS

A. WHO IS THE CUSTOMER? WHAT PROBLEM DO WE SOLVE FOR THEM?

Through the eyes of customers we're just another option for moving cargo/people. Though what we do different is target city transportation's weaknesses — it's crowded, uncomfortable and un-hospitable during rush hour. We remedy this transportation problem with light heartened personalities, comfortable seating and a shockingly smooth experience for cargo/people. Our goal is to be a front runner in the emerging riverway transportation experience.

B. HOW HAVE WE VALIDATED THE PROBLEM?

Our business was envisioned to reduce roadway congestion and help riverway communities quickly move cargo/people. We see Chicago's Riverways almost like a giant express lane slicing

A Growing Presence on the River: Autonomous Boats

Michael Valentino Ochoa (LAST REVISION: 3/2/20)

thru the city, a lane that's been empty far too long.

To validate the city's transportation problem we developed a 16 item questionnaire to better understand people's perceptions, preferences and attitudes about riverway transportation services. Our survey was tested on 32 respondents across different ages, proximity to the river, races, gender and family income level.

portrait of the river to intelligently control its steering dynamics. The boat will be available for 3 roundtrips in the AM, 3 roundtrips in the PM and riverside delivery services throughout the day. Services will be available between the Julia C. Lathrop Homes (2800N) and Park No. 571 (2800S) along the North and South Branches of the Chicago River.

C. OUR SOLUTION

We recognize there is an immense amount of noise in the autonomous transportation industry. For years the challenge focused on engineering, but as the technology gets increasingly commodified, trying to build services in a new regulatory environment has become the new challenge.

Our solution is a low wake autonomous boat with human safety driver aboard.

The boat uses a high definition camera and sensors to generate a detailed

D. MAKING THE REGISTER RING

We plan to make money by: (1) moving cargo for a flat rate (2) hospitably moving people for a flat rate (3) offering buyouts for groups seeking a cannabis inspired tour of the river (4) selling goods abroad the boat.

E. WHAT MAKES US UNIQUE?

Our unique approach blends hospitality and autonomy to help communities with their riverside deliveries/commute. We hope to incite some newfound sociability around riverway services, almost like home-away-from-home and roving corner store on the river.

Generally speaking, our business believes in letting autonomous boats do what they do best (e.g. lane keeping, obstacle detection, active cruise control) and letting humans aboard the boats do what we do best (e.g. being the clever and hospitable animals we are).

F. WHAT KEEP US UP AT NIGHT?

At a time when our generation faces ecological, economic and values crises, some of the best solutions in navigating the path ahead may not be autonomous boats. Technology is not a cure-all solution, but it offers an opportunity to fundamentally redesign systems that help cargo/people get where they need to go more sustainably. Our vision of an autonomous boat is not necessarily the answer, but rather a step in a creative learning process towards healthier cities :)
